Is YOUR pet at risk?

Annual vaccination is not necessary, and potentially harmful publicly stated by:

World Small Animal Veterinary Association
American Veterinary Medical Association
American Animal Hospital Association
Australian Veterinary Association

A number of vets in the UK have also spoken out to confirm this

The American Veterinary Medical Association on boosters:

“No additional protection is provided”

“There is no scientific data to support label directions for re-administration of MLV vaccines annually”

“Vaccines are not harmless. Unnecessary side effects and adverse events can be minimised by avoiding unnecessary vaccinations”

Why risk YOUR pet having adverse reactions to unnecessary boosters and why pay out when you don't need to?

The act of re-vaccinating our pets every year is not only potentially harmful, it is also unnecessary, and is without any scientific basis.

If you or your vet are in any doubt there are now 'in-house' titer (blood) tests available.

We are calling for every animal lover across the world to stop risking the lives of their pets.
