

Dear

Veterinary groups around the world have introduced new vaccination schedules in response to duration of immunity studies and concerns over vaccine safety. The Pet Welfare Alliance supports these guidelines and welcomes a reduction in the number of vaccine antigens given to companion animals. The aim of this letter is to practically support these aims by asking you to effect change in line with the current established science and guidelines provided by those veterinary bodies.

The Pet Welfare Alliance is an alliance of pet owners and veterinarians formed as a watchdog for the pet products industry. Pet vaccination is one of the foremost areas in need of revision, and we believe that recent developments pave the way for positive change.

Currently many/most animal boarding establishments (kennels/catteries/home boarding) believe that proof of annual vaccination is a requirement to board an animal and that local licensing authorities demand proof of annual vaccination. However, the Animal Boarding Establishments Act states “all reasonable precautions will be taken to prevent and control the spread among animals of infectious or contagious diseases” and where vaccination is mentioned in the Kennels and Catteries Act it rightly states that vaccines should be “current”.

With the advent of updated science and guidelines by world veterinary bodies there should be clear guidelines for boarding establishments to adhere to, and dispell the myth that annual vaccination is necessary, beneficial in providing any further protection in already immune animals, or without risk of causing harm. Details of vaccine adverse reactions can be found in the WSAVA guidelines (see links below) that range from mild (fever, loss of appetite etc), to severe/life-threatening (epilepsy, arthritis, AHA, organ failure).

The World Small Animal Veterinary Association Vaccination Guidelines state:

“Core vaccines should not be given any more frequently than every three years after the 12 month booster injection following the puppy/kitten series, because the duration of immunity (DOI) is many years and may be up to the lifetime of the pet. In order to ensure the existence of duration of immunity, titer testing may be used.” Ronald D Schultz, Ph.D., Professor and Chairman, Department of Pathobiological Sciences, School of Veterinary Medicine, University of Wisconsin; Member of WSAVA and AAHA vaccine guideline groups

“Only one dose of the modified-live canine ‘core’ vaccine (against CDV, CAV-2 and CPV-2) or modified-live feline ‘core’ vaccine (against FPV, FCV and FHV), when administered at 16 weeks or older, will provide long lasting (many years to a lifetime) immunity in a very high percentage of animals ([Schultz, 1998], [Schultz, 2000] and [Schultz, 2006]).”

In its 2013 puppy vaccine summary, the WSAVA adds: “The WSAVA states that we should vaccinate against the core diseases no more frequently than every three years. This is often taken to mean that we should vaccinate every three years – but this is not the case. If the dog is already immune to these three core diseases, re-vaccinating will not add any extra immunity.”

The WSAVA new puppy owner guidelines can be found at:

<http://www.wsava.org/sites/default/files/New%20Puppy%20Owner%20Vaccination%20Guidelines%20Updated%20July%2029%202013.pdf>

And the full guidelines at:

<http://www.wsava.org/sites/default/files/VaccinationGuidelines2010.pdf>

The WSAVA on non-core (optional) vaccines (2013)

Leptospirosis

“Vaccination should be restricted to use in geographical areas where a significant risk of exposure has been established or for dogs whose lifestyle places them at significant risk”

“Protection against infection with different serovars is variable. This product is associated with the greatest number of adverse reactions to any vaccine. In particular, veterinarians are advised of reports of acute anaphylaxis in toy breeds following administration of leptospirosis vaccines. Routine vaccination of toy breeds should only be considered in dogs known to have a very high risk of exposure”

Kennel Cough

“Canine respiratory disease complex (kennel cough) is not a vaccine-preventable disease”

“you should check with your kennel because some will demand kennel cough vaccines, and others will not accept dogs that have been vaccinated against kennel cough (due to shedding)”

Essentially, the kennel cough vaccine datasheets warn that vaccinated dogs can develop a mild case of kennel cough. Although said to be mild, vaccinated dogs can infect other dogs with kennel cough. Again, this vaccine is deemed optional by the WSAVA.

The WSAVA on Titer Testing

“The WSAVA supports the use of titre testing. This is where a small sample of blood is taken from the dog and checked for the presence of circulating antibodies. The presence of circulating antibodies indicates that the dog is immune, and revaccination (with core vaccines) is not required. You may decide to titre test before giving the 12 month booster, as this may show that boosting is unnecessary. New in-practice titre-testing kits are now available which will allow your veterinarian to do a titre test very quickly, without sending the blood sample to a laboratory”

The only reliable way of knowing whether a dog is immune is to ascertain whether the dog has antibodies to the core diseases. Vaccination in itself does not offer a guarantee of protection.

The UK Kennel Club on vaccination

Health and Breeder Services manager Bill Lambert said “there are a number of ways in which breeders could choose to protect or immunise their animals”

“While vaccination is a commonly used method, the KC would wish to make clear there is no blanket requirement for members of the ABS [Assured Breeder Scheme] to use conventional vaccination either annual or otherwise”

We asked Mr Lambert to incorporate the WSAVA guidelines into their policy, and at the time of writing he informs us that, “it has been decided that the wording of the advice sheet template for assured breeders will be changed. Once this has been done it will be submitted to the Dog Health Group and General Committee”. You can contact Mr Lambert with any queries about the Kennel Club guidelines on vaccination at:

Bill.Lambert@thekennelclub.org.uk

Vet Waiver

Vaccine data sheets state “not for use in an unhealthy/immune compromised animal” or similar. Vets should be able to provide a letter of waiver of the requirement to be vaccinated on the grounds of health issues to avoid adverse reactions.

UK Vets

The Pet Welfare Alliance has written to all UK veterinary practices and included details of the new in-practice VacciCheck titer test and arranged a discount for them with the supplier.

Proposal

The Pet Welfare Alliance has written to your local authority asking that the following proposals be incorporated in their licensing requirements for all boarding establishments. Accordingly the Pet Welfare Alliance would ask that you, as a boarding establishment:

Incorporate the WSAVA guidelines in your admittance policy so:

- a) That annual vaccination is not a requirement to accept an animal to be boarded
- b) That the accepted period of vaccination for core vaccines should be no more frequently than every three years, and that protection can be lifelong
- c) That proof of a titer test showing that re-vaccination is not required is acceptable for the purpose of boarding that animal
- d) That the Leptospirosis and Kennel Cough non-core (optional) vaccines are not a requirement for the acceptance of an animal for boarding, and that a letter from the animal owner’s vet to state that the animal is in good health and does not have those disease (if felt necessary by the boarding establishment) is sufficient for entry into the boarding establishment
- e) Where it is acceptable/agreed between the boarding establishment and animal owner, a letter from the animal owner’s vet to waive the requirement of vaccination due to health issues, is an acceptable form of authorisation for entry into the boarding establishment (and where necessary the use of isolation facilities could be used)
- f) Where it is acceptable/agreed between the boarding establishment and animal owner, a letter from the animal owner’s vet to waive the requirement of vaccination due to alternative methods of protection/immunisation, is an acceptable form of authorisation for entry into the boarding establishment (and where necessary the use of isolation facilities could be used)

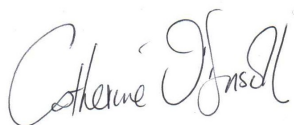

This letter is now available on the Pet Welfare Alliance website (along with the letter to your licensing authority) so that the public have access to this. We are writing to all boarding establishments and licensing authorities in the UK with the aim of enabling long-overdue change.

Currently the WSAVA is working to educate veterinary surgeons with regard to the latest science, and many pet owners are choosing not to over-vaccinate their pets and risk vaccine adverse effects. Quite frequently the requirement to provide proof of annual vaccination to kennel owners is preventing pet owners from following the known science whilst protecting their pets against unnecessary suffering.

We hope very much that you will incorporate these proposals into your licensing requirements and we would be only too pleased to help if you have any questions.

We would be grateful if you are able to confirm that you have adopted these proposals into your policy as we also like to publicise and make available information on our website for the public and relevant establishments alike in order to promote good practice.

Yours sincerely

Catherine O'Driscoll
